

Five Things to Monitor After Every Client Website Goes Live

The CMS can work and the server can stay online while visitors see an unsafe warning, a missing site or a parked domain.

Your connection is not private This site can't be reached Email bounced back

1

Website DNS

Confirm the public A, AAAA and CNAME records still reach the intended host.

2

Authoritative nameservers

Check that every authoritative server returns the same critical records after a launch or migration.

3

The certificate visitors receive

Read the certificate served by the public hostname. A successful renewal job does not prove the new certificate is live.

4

Domain registration and expiry

Watch the public registration state. The application can remain intact while an expired domain shows a parked page.

5

Email DNS

Keep MX and essential TXT records after every DNS or nameserver change. The website can work while incoming mail fails.

It may be another supplier's fault. Knowing first still matters.

DNS Notify watches DNS, nameservers, served certificates and domain expiry. No AI. No noise. Less than £1 per domain each month.
